In stochastic representations an image is considered to be a sample function of an array of random variables called a random field (see Section 2.10). This characterization of an ensemble of images is useful in developing image processing techniques that are valid for an entire class and not just for an individual image.

A digital image  $a[m,n]$  described in a 2D discrete space is derived from an analog image  $a(x,y)$  in a 2D continuous space through a sampling process that is frequently referred to as digitization. The mathematics of that sampling process will be described in Section 5. For now we will look at some basic definitions associated with the digital image.
