Joints are the location where bones come together. Many joints allow for movement between the bones. At these joints, the articulating surfaces of the adjacent bones can move smoothly against each other. However, the bones of other joints may be joined to each other by connective tissue or cartilage.

Physiology of the Joints - 6th Edition

Now in its sixth edition, The Physiology of the Joints Volume Two - The Lower Limb is illustrated in full colour, rewritten and enriched with new text. Conceived and written over forty years ago, it has brought back to centre stage biomechanics, which previously was dismissed as anecdotal in works on human anatomy.

Joints are the areas where 2 or more bones meet. Most joints are mobile, allowing the bones to move. Joints consist of the following: Cartilage. This is a type of tissue that covers the surface of a bone at a joint. Cartilage helps reduce the friction of movement within a joint. Synovial membrane.

9.1 Classification of Joints - Anatomy and Physiology

Synovial joints are characterized by the presence of a joint cavity. The walls of this space are formed by the articular capsule, a fibrous connective tissue structure that is attached to each bone just outside the area of the bone's articulating surface. The bones of the joint articulate with each other within the joint cavity.

The skeletal system -- bones, joints, cartilage, and connective tissue For each system, physiology sheds light on the chemistry and physics of the structures involved.

What Is Physiology? - WebMD

There are two types of slightly movable joints (amphiarthrosis): syndesmosis and symphysis. A syndesmosis is similar to a suture, complete with the fibrous connective tissue, but it is more flexible. Such a joint is useful if the body needs to link two bones, but allow a little flexibility.

Where two bones meet, called the joint, the bone ends are covered with cartilage, also known as gristle. This cartilage is sturdy, elastic and spongy or compressible, and keeps the bones from moving against each other at the joint. The cells of this cartilage, called chondrocytes, are thought to be the longest living cells of the body.
